

GAUSSIAN INTEGER KENKEN

Nothing says KenKen variants must use plain old integers! The symbol $\mathbb{Z}[i]$ denotes the *Gaussian integers*, i.e. combinations of integers and integer multiples of the complex number $i = \sqrt{-1}$. That is $\mathbb{Z}[i] = \{a + bi : a, b \in \mathbb{Z}\}$.

In the Gaussian integers, some things we took for granted before are now a bit crazy. Even though 2 is a prime number in \mathbb{Z} , there are multiple ways to factor it in $\mathbb{Z}[i]$. For example, $2 = 1 \cdot 2$, but also $2 = (1 + i)(1 - i)$.

Before you can make good progress on Gaussian integer KenKen, you should probably brush up on Gaussian integer multiplication. The set $\{1, 2, 1 + i, 1 - i, 1 + 2i, 1 - 2i\}$ is just a small subset of $\mathbb{Z}[i]$, but it's enough to make some nice 6×6 KenKen puzzles. Before you get started, make an addition table, and a multiplication table for this set. (Some of the results from addition and multiplication may land outside this set, but that's not a problem here.)

| + | 1 | 2 | 1+i | 1-i | 1+2i | 1-2i |
|------|---|---|-----|-----|------|------|
| 1 | | | | | | |
| 2 | | | | | | |
| 1+i | | | | | | |
| 1-i | | | | | | |
| 1+2i | | | | | | |
| 1-2i | | | | | | |

| × | 1 | 2 | 1+i | 1-i | 1+2i | 1-2i |
|------|---|---|-----|-----|------|------|
| 1 | | | | | | |
| 2 | | | | | | |
| 1+i | | | | | | |
| 1-i | | | | | | |
| 1+2i | | | | | | |
| 1-2i | | | | | | |

The puzzles on the next page are from John J. Watkins' paper *Triangular Numbers, Gaussian Integers, and KenKen*. Once you get a bit of practice solving them, can you create your own 4×4 or 6×6 Gaussian integer KenKen puzzle?
