1. If a DNA strand is 2 units long, how many nucleotide sequences are possible?

2. If a DNA strand is 3 units long, how many nucleotide sequences are possible?

3. A DNA strand is 2 units long, how many nucleotide sequences are possible if…
   a. There are only 2 types of nucleotide bases
   b. There are only 3 types of nucleotide bases

4. A DNA strand is 6 units long, but only utilizes 3 types of nucleotide bases. How many nucleotide sequences are possible?
5. A DNA strand is 16 units long. However, the bases of units 8-16, inclusive, are fixed (if the base is yellow, it must remain yellow). How many nucleotide sequences are possible?

![Diagram](image)

Can be any of the 4 nucleotide bases

Nucleotide base cannot vary

6. A certain DNA strand is 8 units long. As a young math and biology enthusiast, Timmy discovers that this DNA strand has 5 possible bases in units 6-8, inclusive. How many nucleotide sequences of this DNA strand are possible?
