Berkeley Math Circle  
Monthly Contest 2  
Due October 26, 2003

1. Solve

$$2\sqrt{1+x\sqrt{1+(x+1)\sqrt{1+(x+2)\sqrt{1+(x+3)(x+5)}}}} = x$$

2. The circle  $\omega$  passes through the vertices  $A$  and  $B$  of a unit square  $ABCD$ . It intersects  $AD$  and  $AC$  at  $K$  and  $M$  respectively. Find the length of the projection of  $KM$  onto  $AC$ .

3. A king is placed in the left bottom corner of the 6 by 6 chessboard. At each step it can either move one square up, or one square to the right, or diagonally - one up and one to the right. How many ways are there for the king to reach the top right corner of the board?

4. \*Updated\* In the triangle  $ABC$  the angle  $B$  is not a right angle, and  $AB : BC = k$ . Let  $M$  be the midpoint of  $AC$ . The lines symmetric to  $BM$  with respect to  $AB$  and  $BC$  intersect  $AC$  at  $D$  and  $E$ . Find  $BD : BE$ .

5. One marks 16 points on a circle. What is the maximum number of acute triangles with vertices in these points?
